

Professor Brøchner's
Philosophical Critique

Examined

1868.

Translated from the Danish by Hans Halvorson

[3]

In a recently published work, *Problemet om Tro og Viden*, Professor Brøchner, after having treated and refuted a number of other theories, has at last, out of statements borrowed from some of my occasional writings and from another's report, composed for himself a Something that he calls my "theory". By subjecting this Something to a detailed philosophical critique, the Professor has, with perceptible self-esteem, weighty reasons and many proofs, assured himself that my "theory" is good for nothing, and has recommended his own as the only right one. Since on this occasion I now come to examine the Professor's philosophical critique, my task will thus be to find out which components of the theory ascribed to me I can acknowledge as mine, and how matters stand with the many proofs and weighty reasons.

To understand a critic, one must above all take note of his standpoint. The standpoint on which Professor Br. has placed himself is, naturally, "the strictly scientific". In what he calls the theory's consequences, with respect to the psychological (pp. 178–195), with respect to the ethical (pp. 195–199) and with respect to the religious (pp. 199–210), the critical author has heaped up a number of supposed and real contradictions, which are clearly meant to prove that the [4] theory of faith I have set up must be rejected when one applies the measure of knowledge. What has now been achieved by this? Precisely what I wish. Far from undermining my doctrine of faith, the critique has contributed its share to confirming just what I inculcate again and again on every occasion: that the doctrine of faith cannot possibly stand before the tribunal of science, and that it therefore neither can nor will submit to the verdict of knowledge. To that extent the Professor, in consequence of a scientific self-deception, has come to furnish a confirmation where he meant to perform a refutation. But however much I appreciate the confirmation contained in the critique's refutation, I must at the same time protest just as emphatically against the "arbitrariness" with which the critical author has omitted to take account of what is peculiar to the theory he

means to refute. In the doctrine of faith I have sketched^{*)} faith is, of course, by no means conceived as an acceptance, supported by blind authority and obscure feeling, of these or those supernatural facts, but by inwardly conscious appropriation, personal self-understanding; faith is, on my conception, not thoughtless but essentially self-thinking, an original principle of life and for that very reason a distinctive principle of thought.

It is to faith, not as immediate acceptance but as a principle of thought, that I have ascribed a *critique* of its own, in that I have distinguished sharply between the *critique of faith* and the *critique of knowledge*. What, now, has Professor Brøchner's critique brought to light on this point? Two formal objections, of which the first cancels itself because it is superfluous, and the second falls away because it is unfounded. The first (pp. 190–91) is to the effect that the critique of knowledge cannot acknowledge the critique of faith, and about this there is [5] no dispute at all; the second is to the effect that the critique of faith conflicts with the essence of faith, but it is without foundation. In proof that it is without foundation, we let the Professor speak for himself (pp. 192–93): “When e.g. the account of Paradise ‘with all character-traits contained therein’ is said to have essential and true reality, then for knowledge an ‘inner’ reality, a ‘higher reality’, in which all the character-traits contained in that account are preserved, is only a fantasy-reality, and faith will not be content with a sublimated reality that lacks the facticity on which faith as faith must lay decisive weight. Faith demands that the factual congrue with the ideal, with the faith-ideal, that reality in this sense become a higher reality, but it protests in the most determinate way against that doubling of reality which deprives faith’s object of the real significance of the historical. Were one thus to let Christ’s birth, death and resurrection take place, not in the outer historical reality in which human life has its stage, but only in that higher reality to which they, as falling under the concept of the miracle, must according to the theory belong, then faith would have to see herein an

^{*)}My philosophy of religion has not yet appeared.

annihilation of the whole foundation of Christianity. And science would only be able to grant it right in this, just as science on its own behalf in general, while it protests against being withdrawn from the true reality of ideality, must just as determinately protest against a doubling that falsifies the reality of ideality by setting in its place a bastard-reality, born of fantasy, and one which moreover must become arbitrary and inconsistent. Every miracle would have to acquire that higher reality for its element, but of the miracles that have an external aspect one may only trace those that can be reduced to visions, to 'expressions' of the believer's inner relation to the divine, back to it; at least one may only do so [6] unreservedly with respect to them. Thus e.g. the miracle of the burning bush can become an inner reality, but what now of such miracles as e.g. the crossing of the Red Sea, or the springing forth of the water from the rock at Moses's blow? These one may not deprive of the actuality of outer reality, and why not? Perhaps on a ground of faith? No, on an inconsistent, from faith's standpoint arbitrary, rational regard for the historical facts, which indeed speak for the Jews' having crossed the Red Sea in the sense of outer reality, and for the thirsting wanderers in the desert's not having had to be content with an 'inner', 'subjective' water, or a 'to-come' water, but having been saved from perishing by a water actual in the sense of outer reality, which faith still seeks in an actually existing spring^{*)}.

This piece of critique is remarkable in two respects.

In the first place, it can be seen from it that the theory the Professor attacks is not my theory. The concept of faith he takes as his basis departs from mine to such a degree that I will not waste a word on illuminating the departure. The conception of the miracle that he ascribes to me "congrues" with mine as the square with the circle; anyone who will merely cast a glance into my writings can convince himself of that. Since I conceive the concept of the miracle in the most determinate way not as a concept of knowledge but as a concept of faith, I have no need or incentive whatever to have objective reality explained away

^{*)}As a note is added: "Cf. 4 Moses XX, 11: and they drank thereof, and their cattle."

where it really forms an indispensable moment of the phenomenon of faith. It is in truth not I who have tried to let either the Israelites or their cattle quench [7] their thirst in subjective water: Professor Brøchner's "subjective water" springs solely from his own "spring".

In the second place, we learn from the above statement how immature, thoughtless and helpless faith is after all when it is forsaken by lofty science. Poor science-less faith, then, has not even so much judgment that it can distinguish, in a biblical account, between outer and inner reality, between spirit and letter; and indeed where should it get judgment from, when all judgment comes into being in science and belongs to science? From this one can well explain to oneself that faith, ignorant of the critique of knowledge, must, as far as the account of Paradise is concerned, either take everything literally or reject everything. To distinguish between lower and higher reality, between material reality and reality of spirit, reality for the spirit, requires, after all, sound understanding; but where should faith left to itself get sound understanding from, when all understanding is a fruit of science and belongs to science? Faith as faith may, in the eyes of objective knowledge, do what it will: it is lost. If it attempts by a critique to separate out what does not concern its essence, then it has already, after all, laid hands on "reason", has in the same act begun to "rationalise" itself and prepared its own downfall in science. If it spurns all critique and grasps blindly at what appeals to its "obscure, selfish drive", then it betrays of itself its innate thoughtlessness; objective knowledge, to put it briefly, will hear nothing of thoughts of faith: faith is stupid and shall be stupid, and there's an end of it.

If we ask what entitles philosophical critique to assert so unconditionally the sole right of knowledge in the world of spirit, then to find the right answer we [8] must naturally go back to "the foundation". The author's only light is the light of science; for faith is only a mystery, and the mystery is outer darkness. But when science is allowed without further ado to reject every measure other than its own; when all negotiations about faith and knowledge are conducted from the outset

exclusively from the standpoint of knowledge, when everything is decided in knowledge and by knowledge: what wonder, then, that “the Problem of Faith and Knowledge” comes out in favour of knowledge! It does indeed look as if science, through the critique, were to make good its right to dissolve faith, positive faith in the miracle of revelation; but that is a semblance. Science does not prove its right; it only postulates it; for every proof is a proof of knowledge, thus a proof that presupposes precisely what should first of all be proved, namely that the proof of knowledge has validity in the domain of faith: the fundamental proof is lacking, and, since the fundamental proof is lacking, the whole demonstration moves alternately between *petitio principii* and *circulus in probando*.

Right at the beginning (p. 130) there is put forward, to my great surprise, the assertion that, in order to maintain “the opposition between existence (life) and knowledge (theory)” and between “subjective and objective”, I take the concept of existence in “an arbitrary double meaning” and build “a sophistical inference” upon it. — “*Existence*”, it is said, “is taken, *first*, in order to be asserted as a universal presupposition and necessary condition for every concrete determination, thus also for knowledge, in the meaning of *individual being in general*, and then, in order that through the concept of existence the practical may be claimed a priority and a preponderance, in the meaning of *volitional being* (‘existence is practical’). Without this subreption the argumentation, which is supposed to lead to the conclusion that it is possible to place existence highest and yet retain theory, but impossible to place theory highest and yet retain existence, and further to [9] establish the superiority of faith over knowledge, could not advance at all. And in the proof of this proposition, the first premise—a consciousness can exist without being theoretical, but cannot be theoretical without existing—also contains an untruth. All being in the form of individuality is existence; there can therefore be an existence that is not consciousness, not theoretical. But when *consciousness* becomes the subject of existence, then *existence includes theory*, for *consciousness is only existing as being theoretical*”. Tot verba... , we shall now see what lies in

these verba!

That I really have used, and still intend to use, the word existence not only of the lower, unconscious, but also of the higher, self-conscious mode of being “in the meaning of individual being in general”, I grant without reservation; but how, in a use of a generally familiar word in keeping with common usage, there can lurk either “ambiguity” or “unclarity” or “subreption”, I am unable to see. Wherever the opposition between *existence* and *theory* is treated in my writings, the word *theory* is expressly taken as synonymous with the word *science*, *scientific objective knowledge*. When I say that a consciousness can exist without being theoretical, but cannot be theoretical without existing, it in truth takes a peculiar kind of acuteness to misunderstand the meaning; for the meaning is that a consciousness can exist without being scientific, but cannot be scientific without existing. But when this is incontestably and without any circumlocution the meaning, the clear, obvious meaning, are not logical spectacles of unusual grinding required to discover in so simple a proposition “unclarity”, “arbitrariness”, “subreption” and “sophistry”?

But, it will perhaps be objected, the unclarity is proved after all, and that already on the first pages (pp. 131 ff.), and proved with respect to the conception both of “the subjective” and of “the objective”. Before we go further, then, we will pause a little at these categories and consider each of them more closely by itself.

It is objected that “subjectivity” and “the subjective” are taken in a “*double meaning*”, so that it now comes to express the accidentally individual and the egoistic, which falls outside the objectively valid, and now the universal form of subjectivity”. It is overlooked, says the critical author, that the form of subjectivity also contains what is objectively valid, that the subject takes it up as a norm in itself “without the content being changed, that subjective action can have objective principles, that there is an objectively true and valid element in reason-determined subjectivity. The standpoint of subjectivity, of life, comes in that” (my!) “conception to coincide with the standpoint of egoism”. Into this account

the critique has put something that does not concern me. In my conception of the essence of subjectivity the emphasis by no means falls on the opposition between the individual and the universal, for every existing subjectivity is as such individual-universal, but on the opposition between lower and higher self-regard: the lower self-regard is *egoistic*, the higher is *religious*. At the stage of egoism, individuality comes into manifold conflict with the objective powers of existence; the subjectivity moved by the principle of faith, on the other hand, will know itself reconciled with the divine laws of nature as well as of spirit, in that it does not give up but vigorously asserts its individual essence.

On my way of seeing it, the objectively universal is so far from being able [11] to devour the subjectively individual that self-regard, one's own personal self-regard, on the contrary becomes all the stronger, deeper, more inward, the higher subjectivity stands in the kingdom of spirit. Should it really be the case, as Professor Brøchner asserts, that "the subject takes up what is objectively valid"—what is objectively valid, be it noted, in *knowledge and science*—"as a norm in itself, without the content being changed, that subjective action can have objective"—objective, be it noted, in the sense of knowledge and science—"principles", that otherwise "the standpoint of subjectivity and of life" must "coincide with the standpoint of egoism": then, yes then, it follows incontestably that positive religion must be abolished. Should religious self-regard really be egoism, faith in a personal God egoism, faith in the immortality of the soul egoism, faith in revelation altogether egoism, then it certainly cannot be denied that the Gospel, in spite of self-denial, patience and love, is originally — through "obscure instinct" and "selfish drive" the offspring of concealed egoism, and the hero of Gethsemane the greatest egoist who has lived on earth.

As proof of my unclear and erroneous conception of the objective, the following is adduced (pp. 132–33): "In the same way as the concept of subjectivity, the concept of *objectivity* also receives a *double meaning*. Where the main stages of subjectivity are developed"—reference is made here to my Philosoph-

ical Propaedeutics, § 15—"the objective now means the objective external, or the merely abstract universal, and now the universal and universally valid that encompasses the totality of the subjective. And as the abstract opposition is definitively maintained, it is arbitrarily ignored that at the different stages the subject's [12] determinateness—which especially appears clearly at the stage designated as that of infinite subjectivity—is precisely by virtue of what has been determined as the objective principle of existence, and that it expresses this. It is overlooked that subjective truth is precisely the appropriated and, in the appropriation, essentially identical objective truth".

That the philosophical critic has here, in a rather uncritical manner, mixed together two quite different kinds of the universally valid, the subjective and the objective, can easily be shown. It has, strangely enough, escaped his attention that what is said at the passage cited from the Propaedeutics about "infinite subjectivity" aims not at proving its truth but at proving its untruth. It reads: "In vigorous one-sidedness a choice is made between two mutually opposed ways out. Partly the objective, in all its forms, is so reduced to a mere means that the enjoying individuality can make itself master of things (hedonism, Aristippus); partly the objective, as the universally rational, is so breathed into consciousness that everything finite is transformed into something indifferent; purified and hardened in infinite resignation, the acting subjectivity will determine itself in being determined by fate (Stoicism; Zeno, Epictetus)". That what is aimed at here is a self-deception called forth by the objective is clear from the context, and is, to superfluity, expressly said in what immediately follows, where the characterisation of "*absolute subjectivity*" begins with the following words: "Formal self-liberation ends in the negative; subjectivity"—the subjectivity that would determine itself by virtue of the objective principle of existence—"seeks life, but finds death". It is more than a distortion of my words, it is a thoroughgoing [13] misunderstanding of the whole matter that is at issue here. It is overlooked, according to Professor Brøchner's assurance, that subjective truth—at the stage

of hedonism and of Stoicism—"is precisely the appropriated and, in the appropriation, essentially identical objective truth". But now, as is well known, the Stoic principle stands in decisive conflict with the hedonic; the two principles, then, cannot possibly be equally objective, unless the objective validity of principles is to be recognised precisely by their standing in subjective conflict with one another. The Stoic, certainly, holds himself convinced that the Stoic principle is the only true, universally valid one, that every rational human being ought to live as a Stoic; but the hedonist is, after all, for his part and as a hedonist, just as convinced that the principle of enjoyment expresses "the appropriated truth, equally objective with itself in the appropriation", that the human being who does not understand how to enjoy does not understand how to live either. If the hedonist expresses "the truth, equally objective with itself in the appropriation", then the Stoic expresses the untruth that is, in the appropriation, "equally objective" with itself, and vice versa. Who is now to judge between the contending parties, and from what standpoint is the judgment to be passed? "From the standpoint of theory, of science, of objective knowledge," answers the critical author. But if the philosophical error of the philosophical critique can strike the eye anywhere, it must surely be here. A Stoic can, as is well known, familiarise himself with the hedonic theory just as securely as a hedonist; conversely, a hedonist can be just as much at home theoretically in the Stoic theory as a Stoic, and still the Stoic does not become a hedonist, nor the hedonist a Stoic. Can there be a more telling testimony against Professor Brøchner's "appropriated truth, equally objective with itself in the appropriation?"

How different theories of this nature are from the truly objective theories of science can be seen from examples in plenty. Think of the Pythagorean theorem: how should it be possible to familiarise oneself with the proofs of this theorem and in spite of that maintain a mathematical "standpoint" that stood in open conflict with the Pythagorean? Think of the Copernican system: how should it be possible to familiarise oneself with the proofs by which modern science has

^[14]

established the objective validity of this system, and still maintain an astronomical standpoint that stood in open conflict with the Copernican? Think of the doctrine of colours in optics, of the doctrine of the circulation of the blood in physiology; in short, take whatever knowledge-theories you will, it holds of them all that clear insight into the objectively valid theory coincides with acceptance of the theory. But clear insight into a subjectively valid theory by no means coincides, as Professor Brøchner has so completely overlooked, with acceptance of the theory. And why not? Because the validity of the subjective theory rests essentially on subjective grounds, and subjective grounds on the individual subjectivity.

That the Stoic cannot convince the hedonist, nor the hedonist the Stoic, however much they work at the theories with each other, is a plain consequence of the practical, existential opposition of their standpoints. What in all the world can it help that the Stoic theoretically points out the supposedly objective contradictions in which the theory of enjoyment can entangle the one who enjoys, so long as the hedonic subjectivity continues to posit enjoyment as the highest thing in life? That the contradictions cannot be resolved objectively in an objective theory teaches him precisely that it is not the theoretical but the practical on [15] which the emphasis falls, that the practical is essentially subjective, and subjective practice an art of enjoyment. The art of enjoyment, certainly, cannot resolve all contradictions either, but what does that prove? "That the principle of enjoyment is itself a contradiction!" By no means. It is precisely the hedonist's irrefutable maxim that the enjoyment of life is itself the resolution of contradiction, that the resolution of contradiction is enjoyment. No, it proves only that life presents contradictions that no one, the Stoic as little as the hedonist, is able to resolve. When the contradictions of life become too strong for the Stoic, what does he do then? He takes his own life. But the same, the very same practical way out stands open, after all, to the hedonist too. Theory as theory cannot possibly bring about a change in the subjective standpoint, since the weight of the grounds that are to decide the preference of the one theory over the other depends precisely on the

practical maxim of subjectivity.

If there really could be an objective insight, independent of every individual and subjective fundamental disposition, into the original self-validity of human subjectivity, then it would above all have to be a matter of concern to science to bring the question of the immortality of the soul to a decisive answer; for that the question of the immortality of the soul is inseparable from the question of the individually universal reality of subjectivity, surely no one will deny. But that science, when it comes to the point, can no more prove the impossibility of the immortality of the soul than it is able to prove either its actuality or its necessity, is a settled matter. He who asserts that the impossibility can be decided by virtue of “the objective principle of existence” is just as surely caught in a self-deception as he who thinks that his conviction of the necessity is owed to his knowledge. He who denies immortality denies it manifestly by virtue of a [16] subjective, individual fundamental disposition; his pretended grounds of science are not objectively valid grounds but improbabilities, to which the subjectively bribed reflection imparts a semblance of objective proofs. It is not the same with a judgment of the self’s reality as with a judgment of the reality of the rainbow, or of the cloud, or of the mineral; the reality of the rainbow, the cloud, the mineral is of an objective nature and can be judged objectively according to the universally valid laws of knowledge; but the self’s reality is of a subjective nature and must be determined subjectively. The reality of the objective forces itself upon thought with necessity; the reality of the subjective announces itself only on the condition of freedom. To want to derive the reality that ought to be ascribed to one’s own individual, subjective being from the reality that, according to scientific deliberation, must be ascribed to subjectivity in objective generality, is a backward and self-contradictory procedure, since the judgment about subjectivity in general depends precisely on the judgment about one’s own. The validity that a man feels he *must* ascribe to his own subjectivity rests in the last instance on the validity he *wills* to ascribe to it; in this sense it holds that the determination of reality is

essentially a determination of will.

The cognition that the will as will must necessarily presuppose is not, as Prof. Brøchner with forced superiority would make out, a theoretical cognition, an objective cognition of "the objective principle of existence"; no, it is just the very opposite, it is precisely a practical cognition, a subjective cognition of the subjective principle of one's own existence. It is, in other words, an existential self-cognition; but an existential self-cognition can be called theoretical only by an arbitrary departure from all usage of language.

[17] Whether the existential self-cognition stands, for the rest, on a lower or on a higher stage, this much is at any rate certain, that its further development by no means signifies its transition into objective knowledge; on the contrary! the purer, clearer and deeper the practical self-cognition is, the more distinctly it separates itself from the theoretical. At its first, natural stage self-cognition is immediately sensuous and the corresponding will egoistic; at the spiritual stage of freedom, and so at the highest stage of subjectivity, self-cognition is ideal, and the corresponding fundamental will religious: faith as personal assurance is no theory, it is an inward, original deed of the spirit, an act of the unity of cognition, of self-cognition, of practical cognition, with the fundamental will.

How matters stand with egoism and the cognition of the universal can now easily be made clear; for it is by no means the case, as Prof. Brøchner supposes, that the cognition of the objective universal should be able to free subjectivity from its egoism. Insofar as the fundamentally human is originally in every human being, each single human subjectivity must undeniably be able to express what is universally valid for human existence in proportion as cognition clears itself. But that this universally valid is and remains subjective none the less, its cognition a decisively subjective, practical cognition, is incontrovertible. Practical cognition is a cognition of will, a cognition which, in conditioning the will, is conditioned by the will, a personal self-cognition. So long as there is something impure, drive-bound and egoistic in the will, so long is there also something impure,

drive-bound and egoistic in the cognition, and conversely: the movement goes round in a psychological circle. Stoic egoism is another than the hedonic; but the Stoic is nevertheless just as essentially an egoist as the hedonist. In the objective universal of knowledge there is indeed abstraction from egoism, insofar as there [18] is abstraction altogether from one's own I; but this abstraction is no personal liberation, no actual redemption: the actual redemption is only in faith. All objective knowledge is conditioned by the personal concerns of one's own existing subjectivity being brought into self-forgetfulness; it is therefore impossible that any objective truth whatever should be able to raise the knowing subjectivity to spiritually free self-sufficiency. Where objective knowledge begins, self-regard ends; where self-regard begins, objective knowledge ends. With returning self-regard we have the selfish again, and with it the psychological circle. Objective cognition can be pure, and self-cognition still impure: deliverance is only in faith. One of two, that is faith's dilemma: either the unfree, selfish subjectivity must remain eternally in egoistic, drive-bound self-cognition, egoistic, drive-bound will, or else, on the condition of higher personal aid, let itself be redeemed by the subjectivity that is originally pure, freed from drive-bound egoism, and just for that reason freeing in spirit and in truth.

It is a dangerous thing to confound the subjective with the objective? The believer sees the universally valid in revelation; the unbeliever denies revelation by virtue of the universally valid. If now both of them, the unbeliever as well as the believer, in selfish, passionate zeal go and confuse the subjective universally valid with the objective, what have we then? Why, then we have fanaticism. The fanaticism of faith is well enough known; its mark is that the self-sick subjectivity, in passionate blindness, would transform subjective truth into an objective power, a law of existence, before which all other subjectivities are unconditionally to bow. The fanaticism of knowledge is less well known; but not for that reason [19] less characteristic. It naturally does not have its source in science, but in a selfish distortion of science. Instead of taking the cognition of the personal for what it is,

a subjective, practical cognition, the knower makes self-cognition without further ado objectively theoretical. It is a great psychological self-deception. The knower imagines that the subjectivity from which he proceeds is an objectively universally valid being, an infallible metaphysical consciousness, a true normal subjectivity, while in actuality it is nevertheless only an abstraction from the accidental state of his own individual subjectivity. Far from being freed from "egoism," the knower is on the contrary infatuated by egoism through this self-deception; for to make the accidental bent of one's own subjectivity into the objective standard for all other subjectivities is egoism. What the normal subjectivity, "by virtue of the objective principle of existence," has a need for, that every human subjectivity is now essentially to have a need for, namely to become metaphysical; what the normal subjectivity feels no need for, a personal God, a comfort in prayer, an eternal life, etc., such dreamings and subjective old wives' fancies no true—"objectively true"—human subjectivity may henceforth feel a need for. To feel a need for such things is, after all, to deviate from the normal; to deviate from the normal is to deviate from the universal; to deviate from the universal is to deviate from the truth; the standard is objective. With its objective standard the normal subjectivity now needs only—in all impersonality—to have a little fit of personal zeal for truth, and the smouldering fanaticism of knowledge will betray itself by an attack on faith.

[20] From what has been set out here the difference between my well-known way of seeing and the something that Prof. Brøchner has criticized under the name of my "theory" must surely be conspicuous. By holding fast to this difference it then becomes a fairly easy matter to pass a well-grounded judgment on the scientific worth that can be ascribed, on the whole, to the Professor's philosophical critique.

The critique has taken its point of departure in psychology. Under the heading "*The Psychological Opposition between Will and Knowledge*" there is presented a section reflected in fog-veiled general propositions (pp. 133–160), whose aim is to show how crookedly, arbitrarily and inconsistently I have apprehended the will's

relation to knowledge in my insistence on the essential difference between practical and theoretical cognition. In the proposition I uttered: “what is most subjective of all in subjectivity is the self; but what is selfish in the self is self-determining, is will,” the fundamental error is supposed to lurk. To correct that blunder Prof. Brøchner will then set out: “*from essence-universality’s* determination, which expresses itself in the being-for-itself in the form of liberated universality that is self-consciousness’s,” and apprehend “the essence’s fundamental determination as energy, more closely as selfhood-energy.” If obscurity and profundity are one and the same, then the corrective applied here is undeniably very profound; if foggy generality is a proof of objective knowledge, it shall be willingly conceded that this psychological corrective is couched in objective knowledge. But if the task is a development of the matter, if we, without fear of offending the universal demands of strict knowledge, may actually venture upon making clear the peculiar nature of peculiar relations, then I cannot see otherwise than that the corrective applied with such grand emphasis comes to just about nothing.

What is set up here as a corrective against me is, after all, literally —even down [21] to the watchwords “selfhood and selfhood-energy”—my own view. If anything was to be accomplished here, then, a satisfactory proof would have to be brought that my view was in conflict, not with Prof. Brøchner’s peculiar view, for on this point he has no peculiar view, but in conflict with itself. Now, has such a proof really been brought? We shall examine it. When I say that what is most subjective of all in subjectivity is the self, I have by that very token stated a difference between subjectivity and the self; when I say that what is selfish in the self is self-determining, is will, I have by that very token stated a difference between the self and what is selfish in the self; when I say that what is selfish in the self must, in order to be will in the proper sense, be self-determining, I have by that very token admitted a heightening of self-determining, a psychological ascent from the selfhood-energy’s first obscure, involuntary manifestation to the clear, conscious concentration that expressly marks the will as the act of selfhood positing itself,

asserting itself, resting on itself, i.e. as choosing, resolving, accomplishing will.

If the general could make the matter clear by means of the general in general, then one would certainly have to grant the critical author that he acquitted himself well. For there is surely no shortage of varying assurances about the will in the universal, about the universal in the will, about the will's unity with the universal in general. "The universality that characterizes cognition" is "a universality that strives toward concretion" etc. (p. 135). "Conversely" (p. 136) "the determination of singularity in the will is such a one as with necessity unfolds the universal [22] in itself, because the will is only will as the self-conscious, i.e. according to its concept universal and general, essence's will. The will must unfold itself from the will determined by the single, positing the single, to the will determined by the universally rational that expresses the essence, realizing the universal." Further: "the more the realization of the will removes itself from the instinctual, drive-like, and egoistic, the more it becomes a realization of the universally rational, of the essence's law, an essence-willing, the determinateness of objectivity, of the universally valid, in itself." Thus in every turn of phrase, through every repetition, it is laid down—by a *petitio principii*—that the will's universal is and shall and must be the universal of knowledge, "the determinateness of objectivity, of the universally valid, in itself"; on such a *petitio principii* all scientific negotiations are wasted.

That an enterprising *petitio principii* must be able to beget a rich multiplicity of tautological circular proofs is understandable. By means of the universal in general it is proved provisionally that "the sharp opposition" between theoretical and practical cognition must be abolished, in order that, once this opposition is abolished, it may be properly proved that the universal, without difference between subjective and objective, is the universal, the universally rational, the objectively universal.

There is in Prof. Brøchner's treatment of the utterances he criticizes a clumsiness which can easily lead a less attentive reader away from the main point about

which the inquiry turns. Concerning the marks by which I have sought to characterize the opposition between practical and theoretical cognition, the following is stated (p. 137). “The practical consciousness is to be personal, interested, in conflict with existence, moved by fear and hope, full of self-regard; the theoretical [23] impersonal, contemplative, disinterested, lost in the universal, moved by necessity, forgetting itself in the grounding of the objective.” Having enumerated these characteristic marks, Prof. Brøchner then adds without further ado: “The relative truth in these oppositions is acknowledged through what is developed above, but the abstract and absolute opposition is denied.” That the opposition I laid down between will and knowledge is denied in what the critique has “developed above,” flatly denied—by a confusion of the general with the general in general—I concede; but that anything whatever has come forth “through what is developed above” that could indicate even so much as an attempt either to efface or at least to blur the criteria cited, I cannot possibly concede. So far is the author from having entered upon any particular testing of the particular marks given, that a little further on he even seems to have quite forgotten that I have set up such marks at all. He says (p. 146): “N. lays an emphasis on this determination *practical thinking*, but it nowhere in him acquires an actual conceptual explanation, just as little as the corresponding concept *practical cognition*, and it must on the whole be striking in what way he, during the development of his theory, applies his psychological categories, without sharp conceptual determination and without distinction of the essentially different.”

By seeing how matters stand with this, we obtain a not inconsiderable contribution to a scientific appraisal of the Professor’s philosophical critique.

As proof, and that a decisive proof, that there is in actuality no difference between practical and theoretical thinking, the following reasoning is put forward [24] (p. 146). “*Practical thinking* would most nearly mean a reflection that determines the connection between principle or presuppositions and consequences, between means and end, on the practical’s domain, hence, by presupposition, a formal

developing of consequences of that which is not dissolved in reflection, and this reflection, which would yet in general acquire no place on the paradoxically ethical's domain, would, inasmuch as the action enters, have to be thought as absorbed, made invisible in the action's singularity. Such a practical thinking would, however, in its *form* not distinguish itself from the theoretical thinking that draws consequences from a not yet by cognition assimilated, e.g. from a merely empirically determined, or that forms concepts of construction." But what does this prove? He who concludes: All men are mortal, Caius is a man, therefore Caius is mortal; he *thinks*; he who concludes: All men are cylinders, Caius is a man, therefore Caius is a cylinder, he *thinks*: the latter kind of thinking is "in *its form*" not to be distinguished from the former. But that thinking in *its form* is always thinking was presumably neither what was to be proved nor what the author meant to prove.

If no weight is to be laid on the peculiarity of the principle and the presuppositions, then there is certainly not a trace of difference between theoretical and practical thinking: thinking in general is always thinking. But if this is to be a proof against the essential difference between theoretical and practical thinking, then it carries us a good step further; we then obtain within theory at the same time a proof that the essential difference between metaphysical and mathematical thinking is abolished. He who thinks metaphysically, he thinks; he who thinks [25] mathematically, he thinks: thinking in its generality is always thinking; ergo mathematical thinking in *its form* is not to be distinguished from metaphysical. Will the mathematicians hail this discovery as a new advance in science?

Metaphysical thinking is heterogeneous with mathematical as much in its form as in its content. "Non datur metaphysica in mathesin via," these words of a keenly thinking mathematician^{*)} have a great testimony in the history of the sciences. "It is only by coming forward as mathematical science that mechanics, like the other parts of natural science, has attained the perfection in form, the determinacy

^{*)}C. Ramus: Differential- og Integralregning. Preface.

and evidence, which is a necessary condition for every secure predetermination of phenomena as regulated by the given forces, and so for the possibility of successful applications. The significance of mathematical analysis has often been misunderstood out of ignorance, both considered as the form in which the investigation comes forward and as the means by which it is satisfactorily carried through. It is, however, easy to understand that analysis cannot by its own content alone bring about the discovery of the laws and phenomena of the forces of nature. It serves, on the other hand, to discover these phenomena's mutual connection and their dependence on the determining forces^{**)}."

Analytical mechanics does indeed draw consequences from something "merely empirically determined," from "a not yet by cognition assimilated," insofar as it draws consequences from certain facts given in experience; but this circumstance is very far from either lowering its objective theoretical value or making its thinking homogeneous with "the reflection that determines the connection [26] between means and end on the practical's domain." The Professor's confounding of theoretical and practical reflection everywhere betrays a perceptible want of penetrating analysis of the matter.

Another, still stronger run at leaping the chasm between theoretical and practical cognition Prof. Brøchner has already taken on p. 139, where he particularly stresses "that the will's singularity is the universal essence's form of appearance," and then continues: "In the thus determined single the universal goes to rest only in such a way that the single becomes transparent: the conversion is a conversion from thinking's, and expressly from the theoretical thinking's, universality to the personal living's singularity; but the individual as rationally willing expresses in the singularity the universal, gives it being in its form, which transparently reveals the universal. The difference of form is accordingly governed by the essential unity; the content of consciousness becomes under both forms: as content of cognition and content of will, essentially the same. I cognize duty—and that is

^{**)}C. Ramus: *Analytisk Mechanik*. Preface.

again: I cognize it theoretically—e.g. the duty to fight for the fatherland; I resolve to exist in the cognized, and inasmuch as the resolve is realized, the content, as realized in the single will, is essentially the same.” Although the whole run simply runs out into a confusion of the universal with the universal, even to such a degree that, in consequence of the example set up, one is almost tempted to ask how a man for whom the duty to fight for the fatherland is the theory of “the universal essence” and “the will’s singularity the universal essence’s form of appearance” could have refrained from going along in the last war: I shall [27] nevertheless, so that it shall not seem as if I were taking the thing all too lightly, try by way of further elucidation to show what the result would have been if the Professor, instead of straightway identifying the practical cognition of duty with a theoretical cognition of the objective laws of knowledge, had taken the marks of difference I set up under closer consideration and given himself time to undertake an analysis of the matter.

To test the marks of difference, let one compare for once, e.g., the law of duty with the law of gravity. On my apprehension the cognition of the law of duty is essentially practical, the cognition of the law of gravity on the other hand essentially theoretical; as laws they both, to be sure, have universal validity; but the universal in the law of duty has essentially subjective validity, the universal in the law of gravity essentially objective validity. What this means can be seen when we exchange the marks and make the law of gravity subjective, the law of duty objective. The subjective moment in the cognition of the law of gravity then lies in this, that he who is to come to clear and thorough insight into the law’s validity must *be able* to think and *will* to think, and so be a thinking, willing subjectivity; conversely, the objective moment of the cognition of duty shines forth from this, that he who asks about duty as duty in general is not asking about your duty or mine in particular, not about what this or that subject happens to regard as its duty, but about the self-valid essence of duty. Thus we have now got subjectivity into the cognition of the law of gravity, objectivity into the cognition

of the law of duty; but have these cognitions thereby become homogeneous? The whole thing is empty formalism. As soon as we stress what is peculiar in the validity of each of the two laws, the heterogeneity must strike the eye.

The validity of the law of gravity concerns exclusively bodies as bodies, not souls as souls, not the thinking, willing subjectivities, not the personal in personalities. The law that tells us that all bodies are heavy does not, after all, [28] tell us either that all or that only some personalities are heavy. But when the law of gravity does not concern the essence of personality at all, but only that of corporeality, has its fulfilment not in the *world* of personality but only in that of corporeality: then the one who cognizes is thereby, after all, expressly called upon to look away not merely from *his own* personality, but from *all* personality. With regard to this I call the cognition of so objective, impersonal a law an impersonal cognition.

It is otherwise with the law of duty. The cognition may begin ever so abstractly, ever so seemingly objectively and theoretically: the objective and theoretical is instantly transformed into a semblance when the emphasis falls on the validity. For which existences, then, does the law of duty have validity? Not for the corporeal, but for the psychical, for the thinking, willing subjectivities themselves, and so for personalities. No single will need particularly answer for a conscientious fulfilment of the law of gravity; it will be fulfilled all the same. On the other hand every rational single will has particularly to answer for a conscientious fulfilment of the law of duty; the one single will is not, by virtue of any objective theory, to trouble itself with answering for the other: each is in his singularity to answer personally for himself. As a law of personality the law of duty is in the strictest sense a law of conscience, the question of duty a question of conscience. Is the law of conscience, then, a theory; is conscience perhaps a science? If it stands fast that the existing personality's knowledge with itself in conscience neither is nor can be an objective theory; if it stands immovably fast that every question of duty essentially is and must be a question of conscience, what instruction do we

[29] then get out of Prof. Brøchner's instructive words: "I cognize duty,—and that is again: I cognize it theoretically"?

To make the distance between the practical and the theoretical in the cognizing consciousness really vivid, let one just try to put the law of gravity on the same footing as the law of duty and to treat the mechanical problems as problems of conscience; the absurdity cannot then fail to show itself. How different is not the *knowledge lost in the universal, moved by necessity*, from the cognition that is conditioned by *self-regard* and grounded in *freedom*! When Buffon disputed with Clairaut about the universal validity of the Newtonian law, it surely occurred to neither of the disputing parties to appeal to a personal self-regard and say to his opponent: I feel in my conscience that you are wrong. No, without any self-regard, without outpourings of the heart or personal assurances, the matter was decided objectively, by objectively necessary grounds. How strictly science deals with the objective necessity of its grounds can be seen, among other things, from the fact that Buffon, who held to Newton's law and to that extent was right on the matter, was nevertheless put in the wrong in the dispute itself, since the grounds on which he wished to rely were rejected as "merely metaphysical and unusable in exact science." How different are not the true, irrefutable grounds of knowledge from the true, and yet so easily contradicted, grounds of conscience! When Luther disputed with Zwingli over the dogma of the Supper, no objective theory, be it exact or metaphysical, was able to reconcile the disputants, and why not? Because the question was originally not a theoretical but a practical question, not a question of knowledge but a question of personality, in the strictest sense a question of conscience: each of the disputing parties appealed in the last instance, [30] and with full right, to his conscience. Perhaps Prof. Brøchner will object here that the disputants did precisely each set up his own theory, and just thereby themselves proved that questions of conscience must in the end seek their highest decision in theory; I need then only recall that on neither side was it the theory that bore the personal conviction, but conversely the personal conviction that

bore the theory. Perhaps Prof. Brøchner will object that such decisive self-regards belong to an antiquated standpoint, that Luther with his conscience had not yet got beyond “the obscure, the egoistic and drive-like,” which “hangs together with the individual nature-being’s unopened unity,” to “knowledge’s universal,” to “the determination of essence-universality, which expresses itself in the being-for-itself in the form of liberated universality that is self-consciousness’s”; I need then only point out that a ground of conscience can as little be transformed into an objective ground of knowledge as a grounding of the law of gravity can be transformed into a grounding of the law of duty. Should that turning point in the history of the race ever arrive when “the form of liberated universality” became one with the objective form of theory, so that one’s own personal self-regard flowed out theoretically into “the determination of essence-universality, which expresses itself in the being-for-itself in the form of liberated universality that is self-consciousness’s,” then it would have to be the turning point at which conscience itself, and with it the law of duty, was abolished. Perhaps the Prof. will object that the “objective principle of existence” which runs through the law of duty is of course not objective in the same way as the principle that runs through the law of gravity, that a distinction must necessarily be made between natural necessity and the necessity of freedom, that he has precisely himself admitted this essential difference by emphasizing “the being-for-itself in the form [31] of liberated universality that is self-consciousness’s”; I need then only indicate the consistency with which he at one stroke knocks his own theory to the ground. If weight is really to be laid here on the form of liberated universality, then the difference between the necessary and the liberated universality surely becomes a thoroughgoing difference of principle, hence a difference of sphere, and then—the dispute is ended.

When Prof. Brøchner would combat “the abstract opposition between the universal and the particular,” insofar as it is to condition “the disjunction between knowledge and existence” (p. 132), he is in this wrong only insofar as he would

combat my “theory,” but on the other hand entirely right insofar as he would combat his own. It is what he himself (p. 139) calls “the *determination of singularity* in the will” on which it essentially depends. “Is it overlooked,” the Prof. continues, “in the apprehension of this,” namely of the *determination of singularity*, “that the will is only will as the self-conscious, i.e. according to its nature universal and general essence’s will, then the will’s singularity and the moment of immediacy in it is traced back to the immediate nature-determinateness’s utterance of activity in the drive, the sensible egoistic craving, and inasmuch as this is most nearly seen from the side through which it hangs together with the individual nature-being’s unopened singularity, which stands in immediate opposition to knowledge’s universal, then the activity that proceeds from it is apprehended as everywhere determined by this form of singularity, and, where it does not in general withdraw itself from consciousness, as that which at most is reproduced by consciousness as the in its immediacy with cognition’s universal incommensurable. Is, on the contrary, this apprehension of singularity abandoned—which would little [32] agree with freedom’s being ascribed to the will—and is it held fast that the will’s singularity is the universal essence’s form of appearance, is *spirit*-determinateness, the relation becomes essentially another.”

Whose theory it may be that the Prof. is attacking here I am really unable to guess; only so much can I say, that it is not mine. Yet it could never have occurred to me that anyone who could reasonably be presumed able to read would be capable of extracting so remarkable a misunderstanding from my writings that I should actually be taken to wish to identify the *singularity* of the spirit-will with “the immediate nature-determinateness’s utterance of activity in the drive, the sensible egoistic craving,” etc. How far such an apprehension departs, not only from my way of seeing things as a whole, but expressly from my most definite statements, how far it is from me to wish to make the existence of the will an animal individual existence, I can show merely by citing a couple of examples. “No animal can thus ruin its life and miss its goal as man can; for the animal’s

life is a gift of nature, man's an essential task. As an essential task, the goal of life is an end of self-consciousness, an ideal of freedom. Over against the ideal stands actuality; but actuality, the naturalness that is given, must be worked upon, altered, transformed: here there must not only be labour, here there must be thought, here there must be will, if an ideal is to be actualized. As the existing subjectivity that self-actively strives toward the ideal, man is essentially spirit." (Forelæsninger ov. phil. Propæd. 1860—61 p. 400). That the relation between ideal and actuality must originally be clarified in cognition, I have then not overlooked either; for the interpretation that the Critique (p. 144) would read into the fact that the will can determine itself indifferently against or even in spite of theory, "that it [33] should demonstrate the inaccessibility of the will to cognition," does not concern me. I have insisted as emphatically as possible on the necessity of cognition, the practical cognition of course, of thinking, the practical thinking of course, for the will as spirit-will. "In relation to actuality and the tasks of actual life, practical cognition must absolutely have greater originality than theoretical. The will must indeed, in order to be will, originally presuppose thought; but, for one thing, it is, be it noted, not theoretical but practical thinking that the will presupposes; for another, the will with this presupposing of its own is just as original as thought. Just as there is in thought something that cannot be derived from the will, since thought as thought is not will, so there is also in the will something that cannot be derived from thought, since the will as will is not thought. Certainly such categories as freedom of choice, choice, resolution, etc. fall under the illumination of thought insofar as they become clear in ethical cognition, but in principle they are no less categories of the will; their cognition is essentially practical." (Om teor. og prakt. Erkjendelse p. 7).

The difference between theoretical and practical cognition can be seen expressly from the difference between conclusion and resolution. Theoretical cognition takes shape in *conclusions*, but not in *resolutions*: thought concludes, but the will resolves. The objective conclusions of knowledge form themselves without

self-regard, in contemplative disinterestedness, without fear and hope. And why? Because they form themselves without freedom of choice, without obligation, without personal responsibility. In relation to the law of gravity the knower has no freedom of choice, for the objective grounds admit of no choice; no obligation, [34] for the fulfilment takes place with necessity; no responsibility, for the question of its use does not concern knowledge: knowledge rests in insight. It is otherwise with practical cognition; its problems are problems of the will, its grounds grounds of the will, its conclusions premises for a final resolution. The theoretical cognition of duty by no means leads either to an actual fulfilment of duty or even to insight into what fulfilment of duty means; on the contrary, it leads away from both. "The theory" says that the individual will is the universal, that duty is likewise the universal, and that the will, in resolving to fulfil duty, shows itself at one and the same time as both the particular and the universal. These are empty abstractions. "The theory," however much is said about the concrete, never gets beyond abstraction, the abstraction of putting the concept of the will in place of the will, the concept of duty in place of duty, the concept of resolution in place of the actual resolution. The actual resolution is an inward action; but precisely in the action the will concentrates itself decisively into an individual will with all the peculiarities and limitations of an existing individuality. The example chosen by Prof. Brøchner, going into battle for the fatherland, may illuminate the matter. If for any given individual will there were no other choice than either to go into battle or to break with the law of duty, then there could at a pinch—although the cognition of the law of duty, even in its pure universality, is and remains subjective—be talk of the theoretical transparency of the resolution; but that the duty to fight for the fatherland is a conditioned duty, a duty dependent in its actual conditionedness on particular circumstances and individual terms, is surely seen, among other things, from the fact that it is not without further ado a [35] duty for all, not e.g. for old men, cripples, women and children. That the actual conditionedness can in no possible way be delimited or determined by theoretical

cognition is evident from the fact that an individual who, to judge by externals, is fit for battle, and to that extent obliged to battle, can have his good and sufficient reasons why he resolves precisely not to go into battle. The personal reasons may even be of such a nature that, although in individual self-understanding he is fully conscious of their validity, he nonetheless feels himself obliged not to communicate them to anyone, but resolutely to take the responsibility upon himself and submit to being exposed to misjudgment. Indeed, it is not even necessarily the case that the misjudged man keeps silent about his reasons because he carries some interesting novelistic secret or other; the ethical explanation may simply be the consciousness that his personal reasons would, either for ever or at least for a time, be misunderstood by others. From another point of view something similar shows itself. Suppose that a combatant has, in the heat of battle, been placed at a high post and entrusted with an important charge. The task is then to do, not duty in theoretical universality, for that no one can do—unless it were the pure metaphysics-man—but *his* duty, hence the single, determinate duty. The task is: to obey his orders and at a decisive moment to use his own discretion. Now, as is well known, the situation may easily take such a shape that, if he is really to act on his own discretion, he cannot obey his orders, or, if he is to obey his orders to the letter, he must stand still and watch the battle being lost. Then it is in earnest a matter of taking a resolution: here there is something to fear, and here there is something to hope; here it shall show itself whether the individual will—not the metaphysics-man's metaphysical one, but the actual human being's existing individual will—has character enough to take a responsibility upon itself.

But character! Character is surely not a theoretical something that becomes [36] objectively transparent to itself in an objective theory? No, personally, character is of so subjective, practical a nature that for the resolution itself it can use only practical cognition. Can a resolution taken under the impression of a great responsibility perhaps be deduced theoretically from Prof. Brøchner's theory: "I cognize duty—and that is again: I cognize it theoretically....; I resolve to exist in

the cognized, and inasmuch as the resolve is realized, the content, as realized in the single will, is essentially the same"? When it is a matter of actual resolution and actual responsibility, it seems after all not so very unreasonable to draw attention to the opposition between theoretical and practical cognition.

It is certainly not Prof. Brøchner's intention to abolish all difference between cognition and will; on the contrary! he even thinks he can make me a concession as regards the opposition. But what he holds fast most decidedly is: that this opposition does not concern the content, but only the form. "Both forms: cognition and will, then become primitive expressions for the energy of the essence revealed in self-consciousness as unity, for the self's self-determination through which it, determining itself, realizes itself: in both functions selfhood and energy assert themselves under distinctive fundamental forms" (p. 135). How matters stand more precisely with these distinctive fundamental forms and the functions corresponding to them, and how far the individual will will be able by these functions to bring it to an actual resolution, may be seen from statements such as these: "The cognition that has reached its goal would, as expression for [37] the in-itself transparent essence's energy, in accordance with the one essence's necessary being in both forms, immediately convert itself into the will's energy determined by the essence-cognition, the essence's self-revealedness, and the will that with the most intensive energy, in the most embracing meaning, was essence-willing: realization of the essence according to its concretion, would be a will that immediately converted itself into consciousness, into cognition, and into a cognition that was determined by knowledge's universal objectively valid laws."

If there lies hidden in these and similar statements something that really deserves recognition, it must be something "fine and full of spirit" that I with my coarser sense am unable to discern; for, as far as I can understand, there are contained herein several elements that are even very hard to digest. In the first place, a psychological separation of two forms distinctive of the selfhood-energy, which are not to touch the content, and that although they are expressly opposed

to each other as primitive forms, as “fundamental forms,” is equally illogical and unpsychological. A form that can be altered without the alteration essentially concerning the content is an inessential form, accidental to the content itself, and can by no means be a fundamental form. For what is a fundamental form simply according to its concept? Surely a form filled with essential content, a form whose primitive distinctiveness cannot be altered without the content being altered. So much for the logical; now for the psychological. The duty, e.g., to fight for the fatherland can, in being cognized, quite certainly be apprehended and held fast by itself in the form of “universality and ideality,” and thereupon in the fulfilment be converted into the will’s, i.e. into the “form of singularity and reality.” But can this conversion now be said to be an alteration of form that does not alter the content? Let one just consider the *same determinate* duty *before* and *after* its [38] fulfilment. Before the fulfilment the action is only a possibility, its determinations determinations of possibility and to that extent universal determinations. But the action is surely the content of the duty; the content of the duty is therefore, before the fulfilment, a content in possibility, a content of possibility. But after the fulfilment, how everything is altered! The brave man has fulfilled his duty, he has risked his life. When he, firmly resolved, risked his life, he did not let his existing individual will float away, as one of the many possibilities, in the general stream of possibilities; for he who risks in that way is not a hero but a drunken man who is swept along in the tumult. To risk is, ethically seen, to resolve; to resolve is to risk. In positing the dutiful action as the decisive thing, the resolved man does not raise himself with stoic indifference above the possible outcome—stoic indifference is a psychological weakness that distorts the ethical—but he lets what befalls come upon him, so that the *possible* content of the fulfilment of duty may, through the action, the single actual action, become an *actual* content. In the actual action the will has risked itself as existing individual will, and by putting *its existence* into the content has essentially altered the content. That Prof. Brøchner could overlook so conspicuous an alteration of content is strange.

Stranger still is the effort the Professor makes to explain “the energy of the essence revealed in self-consciousness as unity,” “the self’s self-determination through which it, determining itself, realizes itself” in the two fundamental forms: “cognition and will.” The explanation is really curious. In order to assert the “principle” of cognition—of objective knowledge—over against the will and to see [39] to it that “the subjective essence” may come to be active “*according to its wholeness, its undivided personality,*” the acute psychologist establishes no fewer than three selfhood-energies, independent in principle, in one and the same personal being. The first of these energies is known essentially by its having content in itself, but no form; the two others are distinguished by each of them being in itself a form, distinctive “fundamental forms” without content. That “the energy of the essence revealed in self-consciousness as unity” is in itself formless is expressly seen from the fact that, to obtain form, it must turn first to cognition, then to the will; that cognition and will, each by itself, must be apprehended as pure forms without content is expressly seen from the fact that these forms are in no way able to alter the content.

If we may now take this acute division in earnest, literally, according to the determinations of concept stated, then we do indeed arrive at a dualism that is quite otherwise harsh than the one I pointed out. Is cognition really independent of the will in the sense that it gets its selfhood-energy, not from the will as will, but from the first self-determination, independent of the will, that as yet formless, mystical potency which originally seeks its form in cognition: then we surely have a whole region of knowledge, a circle of objective theories, of which it can truly be said that it stands independent of the will, wholly independent with respect to content as well as to form. For objective knowledge can then by no means depend on the will as regards its content, when the content comes from the formless potency; nor can knowledge depend on the will as regards its form, when the form of cognition has not merely as great a primitivity as the form of [40] the will, but an even greater one. If this is not a psychological dualism, what then

is dualism?

Perhaps we may not lay such weight on the separation of form and content. We will then try it another way and assume that the whole distinguishing between three different kinds of selfhood-energy does not mean much; for by assuming this we seem, at least in some places, to come nearer to the author's meaning. We are told that "the cognition that has reached its goal" would immediately convert itself into the will's energy determined by the essence-cognition; we are told that "the willing that with the most intensive energy was essence-willing" would be "the will that immediately converted itself into consciousness, into cognition," and that into the bargain into a cognition that was determined by knowledge's universal, objectively valid laws. From what is thus said here we get the notion that it is "mediation," the old well-known speculative mediation, that is to rise again and keep step with the reasoning critique. But the critique and mediation cannot be reconciled. If mediation is to rule, it will in no way do to assume an essential alteration of form without a corresponding alteration of content. Say what one will about mediation: in the chapter on form and content it allows no halving; its thinking is immanent, and immanent thinking does not engage in any critical parcelling-out of form and content. How then should we be able to conceive of the cognition that has reached its goal going about converting itself—immediately—into will? The goal of cognition is surely nothing but objective theory, nothing but science. As long as objective cognition has not exhausted all possible material of knowledge, it must of course go forward from knowledge to knowledge without converting itself into will. Since, now, the author will not admit any absolute limit of knowledge, cognition will of course [41] never reach its goal, and the expected conversion will never occur. Suppose that cognition, after having reached a relative goal, converts itself into will: what then halts cognition; what is it that brings about the conversion? According to mediation, cognition would have to halt of itself, of itself pass over into will, because in its essence it is will. But that the critique forbids; the reasoning critique

has expressly posited the form of cognition by itself, independent of the form of will. According to sound common sense it would have to be the will that halted cognition and brought about the conversion; but that conflicts with the theory put forward, which posits cognition as independent of the will. It must, then, be that selfhood-energy formless in itself, that mystical potency which is neither cognition nor will, that has to convert cognition into will. But even when this is assumed, there is still no reason here why cognition, “as expression for the in-itself transparent essence’s energy, in accordance with the one essence’s necessary being in both forms,” should “immediately convert itself” into the form of will. The only reason the explanation contains is a sort of reason why “the in-itself transparent essence’s energy,” after having expressed its content in the form of cognition, can change over and express its content in the form of will. But such a change of form is then very far indeed from signifying the transition of the one form into the other.

If we try to think the transition by starting from the will’s self-conversion into knowledge, we are no nearer. What sort of will is it that — with “the most intensive energy” — immediately converts itself into consciousness? According to the author’s own assumption, the will as will cannot, after all, be without consciousness; the will with the “most intensive energy” must therefore be a will [42] with the most intensive consciousness. But when the will with the most intensive energy itself, namely in the will’s fundamental form, *is* the most intensive consciousness, how then can it *convert* itself into consciousness, into what it already is? Here there is, after all, no conversion. Is the wonderful conversion perhaps to consist in this, that the will, after having for a time kept itself, with a less intensive energy, in the form of ordinary will, simple, practical will of character, at last reaches the most intensive energy, and then suddenly, by means of the most intensive energy, veers round — “immediately,” as when it is said that the wind veers round — and transforms itself from will into not-will, into cognition, into objective cognition, cognition of knowledge’s universal, objectively valid

laws: then the whole explanation will come very close to the meaningless. The philosopher who could make such a conversion clear to us in a definite psychological example, such an immediate objective veering-round in the subjective, would have to be a true theoretical sorcerer, an objective psychological conjurer.

One last way out still remains; that too must not be left untried. In order to maintain the undivided unity of personality with itself in cognition and will, the Professor appeals to what he calls “the energy of the essence revealed in self-consciousness as unity,” to “the self’s self-determination through which it, determining itself, realizes itself,” and so on. It is therefore the relation between the will and the self’s self-determination on which attention must fix itself. According to the customary way of seeing things one might be tempted to assume that the self’s self-determination was properly its original willing, and the will itself the centre of personality; but this is by no means the case. “The energy of the essence revealed in self-consciousness as unity” has, when we abstract from the pseudo- [43] independent self-determination of the energy of cognition — *mirabile dictu* — two kinds of specially determining self-determination “through which it, determining itself, realizes itself.” The first self-determination is the one formless in itself — the mystical potency; the latter, the one empty of content in itself, is the will. The will as will is therefore not the self-determining unity of personality; for the will first comes forth when the first, formless self-determination determines itself to lay the content of consciousness into the other determining self-determination, namely the one that determines the form. The will, seen in this light, is then as good as not accountable. The will, alas, the poor will, has been taken captive by a mystical potency and cannot originally determine itself: its self-determination is each time dependent on whether the self’s first self-determination, “through which it, determining itself, realizes itself,” will determine it to self-determination.

It is on such a foundation that Professor Brøchner would maintain the undivided unity of personality! First he makes, on his own theoretical plenary authority, the existing consciousness into a scientific theory; next he confounds

the subjective validity of the universal with the objective, even to such a degree that he does not see himself able to make a distinction between grounds of science and grounds of conscience, between a cognition of the law of duty and a cognition of the law of gravity. Next, after the spirit-man existing in flesh and blood has been confused with the silhouette of a metaphysics-man bleached out by abstractions, the universal concept of the individual will is by a mistake put in the place of the will struggling for its independence. Finally, after the subjective universal essence with the three selfhood-energies, the one with content without form, the [44] other two with form without content, has become so objectively transparent to itself that subjectivity's original self-determination can in perfect transparency determine itself to the will's self-determination, the goal is reached: action is theory and theory action, the difference at all events only a difference of form that does not alter the content. On such a foundation it is now an easy matter to deny the absolute boundary of knowledge and reject the mystery; on such a foundation a criticizing philosopher can then easily prove both the impossibility of God's personality and the impossibility of the validity of prayer and the impossibility of the soul's immortality.

On such a foundation, an airy substratum of essence-empty abstractions, skewed deductions, smeared-out turns of phrase and short-winded remarks, Professor Brøchner has now really stilted himself up into a philosophical authority, a high priest of knowledge, who purifies faith, preserves "the religious" by "abolishing the religions," and proclaims the gospel of the metaphysics-man, of the "universal human essence," in that knowledge is chosen. Thus run his words: "For inasmuch as knowledge is chosen, there is chosen that which, as essence-expression for the universal human essence, bears in itself the possibility of concluding itself into a totality with inner infinity; that which, inasmuch as it has the ideal primacy in the indivisible human spirit, can become the norm for an ethical life-whole; that which, while it sees through the finite religious forms' essence, comprehends them in their origin out of the self-unfolding, toward its

principle striving human nature, and therefore does not retain in them a disturbing barrier of consciousness, and which, inasmuch as it in the historical religious forms separates the transient and finite from the abiding, essential, and eternal, the non-religious from the religious, can stand in harmony with and take up into itself this essential, the religious according to its true and eternal significance.” [45] (pp. 225–26).

If someone now, after having laboriously worked his way through the Professor’s book *Problemet om Tro og Viden*, were to declare outright that the reason why Prof. Brøchner has on this occasion come forward against the last possible attempt to defend the faith of revelation against the attacks of science is plainly not love of science, but a smouldering hatred of positive Christianity, would one not then answer back vigorously and raise a hue and cry: “No insinuations, no personalities! Test the proofs, but do not mutter about the motives!” I assume that one would do so, and rightly. But what does that prove? It proves, after all, precisely what I maintain, but what Prof. Brøchner will not concede: that there is a difference, a decided difference of principle, between questions of knowledge and questions of conscience, between grounds of science and grounds of personality. It proves precisely what I maintain, but what Prof. Brøchner expressly denies: that there is a difference, an incontrovertible difference of principle, between the clear insight into an objective theory and the “mirroring” of that interior of personality which is never exhausted in any scientific concept.

Two knowers can become objectively transparent to each other in the same knowledge of the same science; but two personalities can never become objectively transparent to each other in the same personal concerns; for this stands fast: the deeper the personality, the richer the inwardness; but no science owns the magic key that opens the door of inwardness.

But although there are depths in existing personalities into which the objective light of knowledge never reaches, it by no means follows from this that a general, [46] approximately grounded judgment could not be passed on personal actions, on

actual characters and their greater or lesser agreement as well with themselves as with the universally human; only that the apprehension, as has been said, becomes a psychological mirroring, not an exhaustive comprehension. With regard to this, then, I can very well, without coming too near the personal, point out that the interest which comes to the fore in Prof. Brøchner's critique before us is not a positive interest of knowledge, but a negative interest of faith. I discern this from the following indications. If it had really been Prof. Brøchner's intention to assert the right of science against encroachment from the standpoint of faith, then he would, on this point at least, have had to side with me. The discussion between us would then have become a scientific discussion about something purely scientific, e.g. about the problems in *Grundideernes Logik*. Of this work there lies before the public a series of analyses running to no fewer than 60 sheets. Here, then, whatever the result might be, there would have been something to investigate. That, alongside these purely scientific endeavours, I thought I could moreover preserve and defend the old faith of revelation, the Professor could, after all, for the time being have let stand as, in his eyes, a psychological curiosum, a "mirroring" of something personal that did not quite let itself be exhausted in the objective concept, at least not until I had got so far that I could present my philosophy of religion as a worked-out whole. But now Prof. Brøchner has gone precisely the opposite way. Far from waiting for an authentic and coherent presentation of my doctrine of faith, he has in great haste thrown himself upon "remarks," "reports," [47] and "aphoristic utterances," has treated every sentence, every word, every jot, urging, specifying, distinguishing, reducing, conceding, restricting, reasoning, and so on, with a zeal as systematic as if he had had a finished system before him. This haste, this zeal plainly points to the chief task being to do away with "the faith of revelation" and get "the religions" abolished in order to be able to preserve "the religious."

That the interest of knowledge does not stand in the foreground I can easily prove. I need, after all, only refer the reader to the assessment of *Grundideernes*

Logik found in the Professor's book (pp. 154–160). For a grounded judgment on this assessment it is not at all necessary that the educated reader be particularly at home in metaphysics and know his way either about the relation between system and schema or about "the power" or about "the antilogical"; if he only has a tolerably clear notion of what an author who has at least set out to achieve something scientific is entitled to demand of the one who would submit his work to a scientific examination, he will without difficulty grasp what everyone who has respect for science must judge of Prof. Brøchner's scientific assessment. For it is certain that a half-metaphysical female, if she only knew how to use such words as "subreption," "surreptitious insertion," "unclarity," "arbitrariness," "sophistry," "metaphor," "category," "not deduced," and the like, in places where they ring well, could in a newspaper article deliver an equally thorough, equally scientific assessment, and on top of that make it quite readable.

That Grundideernes Logik is not to Professor Brøchner's taste must no doubt be explained by several reasons, among others by this, that it does not at all suit his critical talent. "It is an old objection that philosophy hangs on words, [48] that its explanations are verbal explanations, its disputes disputes about words, its wisdom verbal junk. This objection is not wholly without ground when one one-sidedly fixes attention on the shadow sides, on the barren subtleties, the tasteless excesses in empty verbal cleverness, over which a John of Salisbury, an Erasmus of Rotterdam, and with us a Holberg have, each in his age, held court against the clients of speculative knowledge." With these words begins the second part of the logic in question, and perhaps there is something repellent in them. Certainly weight is laid on the word. "Philosophy is the science of the word; it must necessarily hold on to the word, as surely as it will hold on to the thought and hold fast the concept. Just as a soul cannot be without a body, so neither can the concept, as the concept determinate in itself, be without a determining word; for if the thought were not, then there were no word, and if the word were not, then there were no thought either." But in the further development it is

nevertheless stressed with decisive emphasis that the development of thought conditioned by the word ought always to go hand in hand with a corresponding development of the case. Here now, if I am not mistaken, is the real point of collision between Grundideernes Logik and Prof. Brøchner's talent.

That Prof. Brøchner's talent is a critical talent of a peculiar kind, namely a talent for philosophical criticism of words, shall not in this connection be tossed off as a passing assertion, but, by way of conclusion, be made evident by a couple of striking examples. In order to illuminate what he calls "the theory's consequences with respect to the psychological" (p. 178 ff.), the Professor begins with a couple of lengthy citations taken from my book "Om den gode Villie," [49] and then introduces the illumination itself with the following declaration: "We have reproduced these developments, also the 'lazzi' placed toward the end, so completely, because only such completeness can give a clear picture of the way in which the theory must be defended" (p. 183). By this forced run-up the reader is naturally to be impressed into assuming that what I have said is not only some insipid and meaningless twaddle, but on top of that something most unseemly. My words are these: "Does it then stand fast that faith can in no way be transformed into knowledge or knowledge into faith, then it also stands fast that faith can just as impossibly be halved by knowledge as knowledge by faith. Can a consciousness not be halved by friendship and mathematics, then it can still less be halved by ethics and astronomy. There are mathematical friends, but there is no friendly mathematics; there are enamored chemists, but no chemical being-in-love, no enamored chemistry. There can be ethical and unethical astronomers, but astronomy is neither ethical nor unethical. Science is in other words neither ethical nor unethical, neither believing nor unbelieving; love is practical, but science is theoretical." It is only a few lines that are in question here, and yet I concede that he who can shake the fundamental thought compressed in these few lines, where a development of the case is concerned, overturns my whole view. "But" — someone perhaps objects — "Prof. Brøchner has indeed shaken it!"

I answer: Professor Brøchner does not, as any tolerably attentive reader can see, go into the case at all; no, he fiddles with the words: his philosophical critique is in this as in other very important respects a criticism of words, and a rather pusillanimous one at that. One reads (p. 187): “The ‘lively’ analogies N. adds for elucidation are most nearly only a not very successful attempt at the burlesque, and prove, with respect to the matter treated, if possible, less than nothing.”^{*)} [50]

Even in the little piece (pp. 184–186) where the criticizing author, after sundry [51] circumlocutory remarks, at last acts as though he were going into the case, the critique nevertheless continues to be a criticism of words, in which one skewed remark relieves the other. “Inasmuch as knowledge acknowledges its boundary, it acknowledges in that which is faith’s sphere a mystery for knowledge. Inasmuch

^{*)}Had Prof. Brøchner, with regard to “the mathematical friends” and “the friendly mathematics,” really elucidated, or even merely made an attempt to elucidate, something that concerned “the matter treated,” then we might perhaps have received an interesting elucidation of how the personal relation between mathematical friends can contribute *either to weakening or to strengthening the objective mathematical proofs*, how, in other words, grounds of personality can be transformed into grounds of science, an elucidation that would surely not fail to bring about a great revolution in mathematics as well as in the other sciences. But instead of elucidating something about the matter, the Professor has, perhaps on personal grounds, preferred to elucidate something about the words. The elucidation is “that one cannot without further ado, because an adjective can be predicated of a substantive, therefore, conversely, predicate an adjective corresponding to the substantive of a substantive corresponding to the adjective,” an elucidation which, as far as the matter goes, stands about on a level with Per Degn’s elucidation of Imprimatur: “All the words that can be named are referred to 8 things, which are Nomen, Pronomen, Verbum, Participium, Conjugatio, Declinatio, Interjectio.”

To what degree Professor Brøchner can forget the case merely in order to criticize the words, and how strict he is when he criticizes the words, is seen from this, that his acuteness has been able to discover “the burlesque” even in the examples cited. Propriety is a virtue, even in a philosophical exposition. But since the boundary of the proper is, after all, not objectively scientific, the philosophizing personalities can nonetheless also push the demand for propriety so far that the exposition suffers for it. If the Professor sees himself able to prove in “a theoretically exhaustive determination of the concept” that I have in the examples cited mixed in “impure ingredients” which can be brought under the category of “the burlesque,” then I must of course bow to objective, incontrovertible grounds; but until such a proof is presented, I reserve my personal right. For it is really my conviction that philosophy, even if it were personified in the pure metaphysics-man and by this transformation — which of course would not be permitted to touch the content, but only the form — had become as proper as an old schoolmistress: the old maid, unless she had a hysterical fit of crossness, would still have trouble finding “the burlesque” in my innocent examples.

as faith has a boundary against knowledge, that which is knowledge's object becomes a mystery for faith. Faith is accordingly knowledge's mystery, knowledge faith's, and the mystery, which, thus apprehended, has nothing mysterious, in this way does not prevent the restriction, but precisely expresses it." This example of an empty play on words may figure here as *instar omnium*; only one must grasp "the fine point." "The fine point" is that a mystery, when one knows what it is: "a boundary against knowledge," is no longer a mystery; for one knows, after all, what it is: "a boundary against knowledge." So a secret, when I know what it is, namely that which I cannot know, is no longer any secret, for I know, after all, what a secret is, namely: that which I cannot know.

The following remark is perhaps not quite so empty, but it is both crooked and skewed. "Knowledge is, by understanding the *intermediate determinations hidden in the mystery*, to be able to think the power-revelation, 'in which the believer sees the miracle,' as subsisting with the laws' immutability, but this it can only [52] when it, while the miracle's name is preserved, lets the miracle as *miracle vanish in a supposed rational*." Readers who wish to know my view of the miracle in a corresponding development of the case I refer to my *Forelæsninger om Hindringer og Betingelser for det aandelige Liv i Nutiden* (IX and X); about the remark in the criticism of words before us I can be brief. What is characteristic of the miracle is not at all that a breach is made in the laws, but that a fact is immediately referred to God's almighty will. That the fundamental relation between the realm of nature and God's almighty will is a relation of inner infinity, therefore a relation in which the will works as one with the laws, can be seen in all generality, without the fundamental relation itself in its actual articulations therefore ceasing to be an absolute mystery for knowledge as well as for faith. Whether such a mystery is to be accepted or denied is not a question of science; no, it is now as before a question of conscience.

An uncritical confusion of questions of conscience with questions of science is surely the strongest testimony against the scientific character of Prof. Brøchner's

philosophical critique.
